OPERATION MODES

UPS Operation Mode

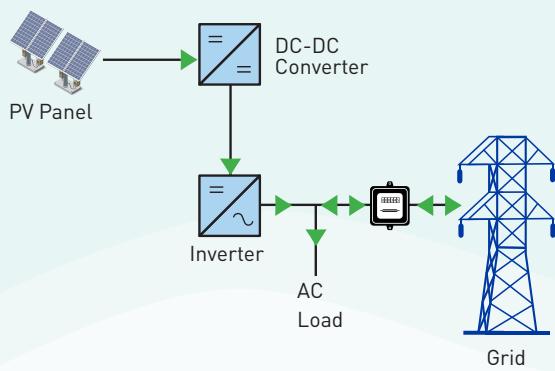

The energy needed by the load is primarily provided from the grid. In case of failure or failure of the grid, the energy needed is supplied from the battery group inside the Estia Hybrid.

Off-Grid Inverter Operation Mode

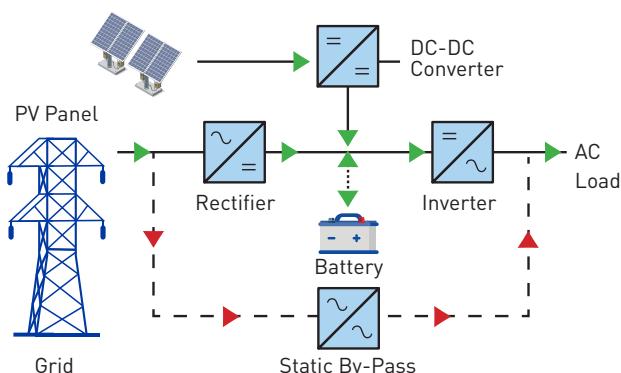

The energy needed by the load is primarily provided from the sun. After sunset or when the panels fail to produce, the energy needed continues to be provided from the battery pack.

On-Grid Inverter Operation Mode

The energy needed by the load is provided primarily from the sun and is supplied from the grid where the solar energy is not sufficient. If the load is low, the energy generated from the solar panels is transferred to the grid.

Hybrid Inverter Operation Mode

The energy needed by the load is provided primarily from the sun and is supplied from the grid where the solar energy is not sufficient. In case of failure or failure of the grid, the energy needed is supplied from the battery group in the Estia Hybrid.
